CS496 AI ENGINEERING · FALL 2026 · TASK 9

Nabta app features

What the app must do for the final demo and the plant study, and what can wait.

Must-have build first

Plant status	See soil moisture, temperature, humidity, light and the water tank level.
Automatic watering	The pot waters itself when the soil is too dry.
Alerts	Warns when the tank is empty, a sensor fails, or the plant is too hot or too dark.
History	Charts of the last 24 hours and the last 7 days.
Water saved	Compares the Nabta pot with a pot watered on a fixed schedule.
Ask Nabta	A chat that answers questions about the plant in plain language.
Decision log	A list of every watering, with the reason for it.
Water now	A button to water by hand, still within the safety limits.
Plant check	A weekly form for height, leaf count, wilting and a photo.

Nice-to-have only if there's time

Notifications	Alerts on the phone even when the app is closed.
Next watering time	Predicts when the plant will need water next.
Photo timeline	The weekly photos side by side to see the plant grow.
More languages	French / English switch, then answers in Darija.
Second plant	Support for basil as well as mint.
Remote access	Use the app away from home Wi-Fi.

How we chose: a feature is a must-have if the final demo or the plant study can't work without it. Everything else waits until the must-haves work.
